                                                                                                                                                                                                                                                                                                   The present invention describes an isolated nucleotide sequence (I) encoding at least a portion of the human alpha-7 neuronal infoctinic encoding at least a portion of the human alpha-7 neuronal infoctinic encoded by (I); (2) a vector comprising (I); (3) a host cell transformed with a vector of (2); (4) a polymucleotide comprising at least 15 nucleotides which hybridises under stringent conditions to at least a portion of (I); (5) a method for detection of a polymucleotide encoding alpha 7-hahchr in a biological sample; and (6) a method for amplification of nucleic acid from a sample suspected of containing nucleic acid conding alpha 7-hahchr. The primers and probes from the present encoding alpha 7-hahchr. The primers and probes from the present suspected of suffering from schizophrenia, small cell lung carcinoma, breast cancer and nicotine-dependent illness. This is particularly useful for dagnosis of schizophrenia, other illnesses that can be table structularly useful structularly and Angelman's syndromes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

Antisense oligonuclectides (ASO) for inhibiting a tumour necrosis factoralpha (TNP-alpha) gene in an animal, preferably a human, comprise 12-50 nucleotides, 90% of which are complementary to a region of mRNA containing a GGGA sequence motif. The ASO is used to inhibit expression of a gene in an animal and for treating the animal when afflicted with a sissase or disorder characterised by the presence of an mRNA from a gene containing a GGGA motif. The ASO are specifically targeted to a GGA sequence motif found in mRNA from a gene. A study of known ASO has shown that at least half of the most effications ASO's contain one or more TCC motifs. This ASO comprises a TCCC motif followed by a cytosine residue and corresponds to a region of the human ICAM-1 3' untranslated region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Respiratory disease; pneumonia; bronchitis; heart disease; sarcoidosis; sinusitis; purulent otitis media; erythema nodosum; pharyngitis; vaccine; neutralising epitope; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                         Generation of antisense oligonucleotides - by specifically targeting a GGGA motif found in mRNA sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       0; Gaps

C. pneumoniae causes respiratory disease such as beneumonia and bronchitis and is thought to be contributing factor in heart disease, sarcoidosis, sinusitis, purulent otitis media, erythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAX94884 - AAY38879) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae especially where the vector directs the expression of a neutralising

AAX91991-X97517 represent PCR primers used to amplify open reading frames and other nucleic acid sequences from the genome of Chlamydia pneumoniae (see AAX91990). C. pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent othis media, erythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAY34584 - AAY35879) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae especially where the vector directs the expression of a neutralising
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Respiratory disease; pneumonia; bronchitis; heart disease; sarcoidosis; sinusitis; purulent otitis media; erythema nodosum; pharyngitis; vaccine; neutralising epitope; PCR primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AAX91991-X97517 represent PCR primers used to amplify open reading frames and other nucleic acid sequences from the genome of Chlamydia pneumoniae (See AAX91990). C. preumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent critis media, erythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAX3484- AAX35879) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae especially where the vector directs the expression of a neutralising epitope of C. pneumoniae
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Respiratory disease; pneumonia; bronchitis; heart disease; sarcoidosis; sinusitis; purulent otitis media; erythema nodosum; pharyngitis; vaccine; neutralising epitope; PCR primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New nucleic acid molecule encoding a biologically active DKR polypeptide, useful in treatment of cancer, e.g. mammary tumors and stem cell tumors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AAA08849-60 are oligonucleotide primers and adaptors used in cloning the murine DKR-3 gene (AAA08838). The murine DKR-3 open reading frame has bloomology to human rig-like 7-1 murine DKR-3 open reading frame has elest 4 gene. DKR-1 is a human ortholog of dkk-1 (dickkopf-1), a novel gene identified in Kenopus and mouse, purportedly an artagonist of wnt-8 pattern. DKR-2, -3 and -4 are each related to DKR-1 by their cysteine pattern. DkK-1 is also involved in morphogenesis in the developing embryo, and therefore a growth factors. The DKR polypeptides are also growth factors. The DKR polypeptides are useful for treating cancer, e.g. mammary tumors, stem cell tumors, or other cancers in which the wnt and/or soulc hedgebog (shh) signal transduction pathways are activated. They can also be used to enhance tissue differentiation, such as bone formation and hematopoietic cell formation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  DKR-3; human rig-like 7-1 mRNA; chicken lens fiber protein; clfest 4; dkk-1; dickkopf-1; antagonist; wnt-8 signaling; morphogenesis; primer; growth factor; cytostatic; sonic hedgehog; tissue differentiation; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
nucleotides sequences can also be used as immunogenic compositions, especially where the vector directs the expression of a neutralising epitope of {\tt C}. pneumoniae
                                                                                                                                                                                                                                                                                                             0; Gaps

The invention relates to the isolation of the gene encoding the human multiple tumour suppressor 1 (MTS1) (AAA95633). The MTS1 protein has a cytostatic activity and is used in protein replacement therapy. This sequence is a PCR primer used to isolate the mouse pl6 gene (a homologue of the MTS1 gene). MTS1 is useful in diagnosing human cancers such as (ocular) melanoma, leukemia, astrocytoma, glioblastoma, lymphoma, glioma, Hodgkin's lymphoma, multiple myeloma, sarcoma, myosarcoma, cholangiocarcinoma, squamous cell carcinoma, CLL, and cancers of pancreas, breast, stomach, brain, proteter, bladder, thyroid, ovary, uterus, testis, kidney, colon and rectum. The MTS1 gene and protein is useful in gene therapy, protein replacement therapy and protein mimetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel protein composition useful in protein replacement therapy for diagnosing and treating cancer comprises a specific weight percent of human multiple tumor suppressor 1 polypeptide.

The present invention describes oligonuclectides containing bioreversible phosphate ester groups and their mimetics. The oligonuclectides are of value in therapeutics, diagnostics, and as research reagents The compound from the present invention may be used in control of hereditary, metabolic, and/or cellular processes in any organism utilising DNA-RNA transcription and/or RNA-protein translation. These organisms include prokaryotic and eukaryotic unicellular and multicellular organisms; including bacteria, yeasts, protozoa, algae, and all plants and higher andian forms, including warm blooded animals, particularly humans; also companal forms, including warm blooded animals, particularly humans; also animal forms, including warm blooded animals, particularly humans; also companalle sub-cellular translation and transcription processes. The new synthetic process provides pro-oligonucleotides, i.e., oligonucleotides by intracellular and intercellular enzymes to generate an active oligonucleotide, as for prototogs and drugs. By careful selection of protecting groups include 8-pivaloylmercaphocethyl (SPME) and of phosphate linkages can be achieved in the reaction sequence. Suggested specific groups include 8-pivaloylmercaphocethyl (SPME) and companylment organisms of (CCCH_2CO) and its analogue with a catechol biresidue replacing the oxygen atom (1,2-phenylenedioxy-diacetic acid). The present sequence in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

Peroxisome proliferators are agents that induce peroxisomal proliferation. Peroxisome proliferator-activated receptors (PPARS) are members of the steroid receptor superfamily, and are ligand-activated transcription factors. There are three mammalian subtypes of PPAR, alpha, beta (also known as delta) and gamma. The present invention relates to inhibiting angiogenesis by contacting PPAR gamma with a PPAR gamma characterised by excessive neovascularisation e.g. rheumatoid arthritis, psoriasis, atheroselerosis, diabetes, retinopathy, retrolental fibroplasia, neovascular glaucoma, age-related macular degeneration, fibroplasia, thyroid hyperplasias, Grave's disease, tissue transplantation, chronic inflammation, lung inflammation, endometriosis and obesity. The present sequence is a PCR primer for human PPARbeta
                                                                                                         neovascularisation; tumour growth; metastasis; rheumatoid arthritis; psoriasis; atherosclerosis; diabetes; retinopathy; PPAR; Human; retrolental fibroplasis; age-related macular degeneration; neovascular glaucoma; hemandaria, thyroid hyperplasis; Grave's disease; inflammatiobesity; transplantation; transcription factor; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Endocrine disruptor; dioxins; organic halocarbon; phenol; agrochemical; phthalate esters; aromatic hydrocarbon; organotin compound; oestrogen;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Inhibiting angiogenesis comprises administration of PPAR gamma ligands for treating tumors, neovascularization and rheumatoid arthritis.
                                                                                       Peroxisome proliferator activated receptor; angiogenesis inhibition

disruptor is new and comprises isolation of mRNA from cells, tissue or organism which have come into contact with the endocrine disruptor, and hybridismism which have come into contact with the endocrine disruptor, and hybridismism which have come into contact with the endocrine disruptor, and hybridisming it with a DNA array containing immobilized gene fragments from genes which may be affected by the endocrine disruptor. The results of the hybridisation are then compared with a comparison sample to catablish which genes have altered by the endocrine disruptors such as disruptor inso organic halocarbons, phenols, phthalate esters, aromatic hydrocarbons, agrochemicals, organotin compounds, oestrogens, mylex, toxaphene, aldicarb and kepones. The types of genes whose expression may be altered by these disruptors include those involved in nuclear receptor transcriptional coupling, kinase type signal transduction, gonad differentiation, receptor type kinases, intermediate filament markers, cell cycle and growth regulation, oncogenes and tumour suppression, and evelopment regulators, cell adhesion, motility and invasion, aniogenesis regulation, invasion regulation, cell-interaction, Rho family small GTPase regulation and growth factors and cytchines.

Completed sequences AAAS9772-AS9831 represent primers used to amplify the conceptor of all conceptors of genes which may be affected by an endocrine

This sequence is a PCR primer for DNA encoding mouse beta, protein which is homologous to the human MYSIBlbera protein. The invention relates to a method for diagnosing a polymorphism associated with a predisposition to cancer by detecting a germ-line alteration of a wild-type Multiple Tumour Suppressor (MYS) gene or its expression products in a human sample. The method comprises detecting a germ-line alteration of a wild-type MXS gene or its expression products in a human sample. The method comprises detecting a germ-line alteration of a wild-type MXS gene or its expression products in a human sample, the alteration indicating a predisposition to at least one of the cancers. The cancer is selected from melanoma, leukaemia, astrocytoma, glioblastoma, lymphoma, glioma, Hodgkin's lymphoma, chronic lymphocytic leukaemia (CLL), and cancers of the pancreas. Dreast, thyroid, ovary, uterus, testis, kidhey, stomach and rectum. The method may be used as the basis for developing very important diagnostic tests capable of predicting the predisposition to cancer. The MYS gene is involved in the progression of multiple tumour types and may provide means for a general anti-cancer therapy by virtue of its ability to suppress tumour growth
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Multiple tumour suppressor; MTS2; human; diagnosis; Hodgkin's lymphoma; cancer predisposition; melanoma; leukaemia; lymphoma; glioma; MTS1Elbeta; PCR primer; ss.

```
This sequence represents a PCR primer for the human multiple tumour suppressor IEIbeta (MTSIEIbeta) coding sequence. The invention relates to the human MTS2 DNA and protein sequences. The DNA sequences are useful to diagnosing or determining a predisposition to cancers e.g. melanoma, leukaemia, lymphoma, glioma, Hoddxin's lymphoma and cancers of the pancreas, breast, thyroid, ovary, kidney, uterus and stomach
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      DBL gene; Duffy-binding like gene; ebl-1; Duffy Antigen Binding Protein; DABP; Sialic Acid Binding Protein; SABP; malaria; vaccine; immunisation; protozoacide; eba-175; PCR primer; ss.

admixed with a topical delivery agent. The compositions can be used for the delivery of a ribozyme, an external guide sequence, an antisense ON, on antisense peptide nucleic acid, an aptemer or a molecular decoy. The ONS can be used to modulate expression of a cellular adhesion protein or used to treat psoriasis. They can also be used to treat psoriasis. They can alignant melanoma, paget's disease, carcinoma, squamous cell carcinoma, malignant melanoma, paget's disease, carcinoma, squamous cell carcinoma, malignant melanoma, paget's disease, bacterial infections of the skin. They can be used to treat humans and primates, avians including chickens and turkeys, domestic household, of sprimates, avians including rats, mice, rabbits and guinea pigs, fish, reptiles and zoo animals. The compositions and methods may also be used to examine the function of various proteins and genes in vitro in the constant of the constant of the care of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 8
                                                                                                                                                                                                                                                                   The invention relates to ebl-1 polypeptides that are encoded by the DBL (Duffy-binding like) gene family. The ebl-1 proteins are substantially identical to the Duffy Antigen Binding Protein (DABP) and Sialic Acid Binding Protein (DABP), which are soluble proteins that appear in the culture supernatant after erythrocytes infected with malaria release merozoites. Immunochemical studies indicate that DABP and SABP are the respective ligands for Plasmodium viox and Plasmodium falciparum Duffy and sialic acid receptors on erythrocytes. The ebl-1 polypeptides may be used to vaccinate against malaria, especially caused by P. falciparum. Immunization with the polypeptide provides effective protection against malaria. Squences AAZ98297-304 represent primers used for isolating sequences encoding the conserved motifs of the DBL family
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Antisense inhibitor; oligonucleotide delivery agent; erythema multiformic expression modulator; cellular adhesion protein; malignant melanoma; cellular proliferation modification; toxic epidermal necrolysis; psoriasis; lichen planus; carcinoma; Paget's disease; Kaposi's sarcoma; pulmonary fibrosis; Lyme disease; infection; therapy; ICAM-1; ss.
                                                                                          Isolated protein binding domains from Plasmodium vivax and Plasmodium falciparum erythrocyte binding proteins useful for vaccinating against malaria.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

```
polynucleotide sequence of the human MTSIE1-beta. (I) is useful for introducing wild-type MTS function to a cancerous or pre-cancerous cell which carries diminished or mutant MTS alleles for suppressing neoplastic growth of the recipient cells. (I) is also useful for increasing the recipient cells. (I) is also useful for increasing the level of expression of MTS gene even in tumour cells in which the mutant gene is expressed at a normal level but the gene product is not fully functional. A host cell transformed with (I) is useful as a model system to study cancer remission and drug treatment which promotes such cemission. The present invention relates to somatic mutations and germ line mutations in the MTS gene and their uses in the diagnosis and prognosis of human cancer e.g. melanoma, leukaemia, astrocytoma, glioplastoma, lymphoma, glioma, Hodgkin's lymphoma, and cancers of the pancreas, breast, thyroid, ovary, uterus, testis, kidney, stomach and rectum. The present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Antisense oligonucleotides for treating hepatitis and colon, liver or lung cancer are inhibitors of Fas, Fas ligand or Fas associated protein 1 (Fap-1) expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human, Fas; Apo-1; antisense compound; Fas ligand; Fap-1; hepatitis;

AAZ69579 to AAZ7740 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the numan genome, and in complex association studies and haphotyphing studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficacious responses to and side effects from
                                   AAC61821-19 represent antisense oligonucleotides which are directed against nucleid acids encoding human Fas Ilgand. The specification describes antisense compounds which are targeted to the 5'-untranslated region, translational start site, translational termination region or 3'-untranslated region of nucleic acid molecules encoding Fas, Fas Ilgand (FasL), or Fap-1 (Fas associated protein 1, protein tyrosine phosphatase). The antisense compounds are used to inhibit the expression of Fas, Rasio or Fap-1 in cells or tissues. They are used to traat autoimmune or inflammatory diseases such as hepatitis. They can also be used to treat cancer, especially colon, liver or lung cancer or lymphoma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel biallelic markers used to construct a high density disequilibrium
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human biallelic marker downstream amplification primer SEQ ID NO:11617.

Human, SHP-1; Src homology region 2-domain phosphatase; phosphorothíoate, cytosolic tyrosine phosphatase; antisense oligonucleotide; cancer; leukaemia; inflammation; infection; ss.
                                                                                                                                                                                                                                                                                                                    Novel antisense oligonucleotides for modulating the expression of human SHP-1, especially for treating a disease or condition associated with SHP
                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to antisense oligonucleotides which modulate the expression of human SHP-1 (Src homology region 2-domain phosphatase) a cytosolic tyrosine phosphatase. The invention includes antisense molecules AAA09644-A09683 which have modified phosphorothioate internucleoside linkages which target various regions of the SHP-1 gene. The oligonucleotides inhibit the expression of human SHP-1 in cells or tissues, and may be used to treat diseases or conditions associated with SHP-1 expression e.g. cancers, specifically leukaemia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AGP-3; tumour necrosis factor ligand; TNF ligand; Crohn's disease; type II transmembrane protein; B cell stimulatory factor; inflammatory disorder; immune disorder; rheumatoid arthritis; lupus and graft versus host disease; PCR primer; ss.

PCR primers AAA63936-37 were used to amplify cDNA encoding a murine AGP-3 polypeptide. AGP-3 is a tumour necrosis factor (TNF) ligand family member. AGP-3 is a type II transmembrane protein, and is a potent B cell stimulatory factor. Expression of AGP-3 correlates to increases in the number of B cells and immunoglobulins produced. AGP-3 proteins, antibodies, and nucleic acids may be used to treat inflammatory and immuno disorders, e.g. rheumatorid arthritis, Crohn's disease, lupus and graft versus host disease. The nucleic acids may be used to regulate the expression of an AGP-3 related protein. The AGP-3 proteins, antibodies and nucleic ands are also useful for the detection of AGP-3 agonists, antagonists and characterizing interactions with AGP-3 related proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New oligonucleotide compositions used for the non-parenteral delivery of
                                                                                                                                                            Novel polypeptides comprising tumor necrosis factor ligand family protein, useful for treating inflammatory and immune disorders, e.g. rheumatoid arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Hardee GE, Ecker DJ, Manoharan M;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ICAM-1; cellular adhesion; expression; modulation; antisense; non-parenteral; delivery; uptake; administration; emulaton; ulcerative colitis; Crohu's disease; inflammatory bowel disease; cellular proliferation; ss.

This invention describes a novel method for determining the identity of a specific nucleotide at one or more defined sites in a target nucleic acid polymer involves formation of a detectable primer extension product if the specific nucleotide is present at the defined site in the target nucleic acid. The method is specifically used to detect point mutations which are associated with altered pathogenicity or resistance to therapy
                                                                                                 Sequences AAZ49336-Z49343 and AAZ49390 represent antisense oligonucleotides designed to modulate cellular adhesion. The invention relates to new compositions for the non-parenteral delivery of oligonucleotides comprising at least one oligonucleotide in an emulsion. Oligonucleotides delivered via the compositions of the invention can be used to modulate expression of a cellular adhesion protein, modulate a rate of cellular proliferation, or have biological activity against evikaryotic pathogens or retrovituses. They can be used for treating conditions including e.g., ulcerative colitis, Crohn's disease, inflammatory bowel disease or undue cellular proliferation. The compositions can enhance the local and systemic uptake and delivery of nucleic acids via non-parenteral routes of administration (e.g., via the alimentary canal, skin, eyes, pulmonary tract, urethra or vagina)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Identifying the nucleotide at specific position in a target sequence for detecting disease-related point mutations involves extending a primer that binds adjacent to the specific site to incorporate a labeled deoxymucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gabe
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Detection, primer extension, point mutation, pathogenicity, therapy; cancer, genetic disease, K-ras, human, PCR primer, mutation, ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This invention describes a novel process (M1) of reverse transcribing mRNA species present in a sample from an organism by: (a) reverse transcribing the mRNA species using a first heeled primer, to provide a first strand cDNA species using a first heeled primer, to provide a first strand cDNA species using a second heeled primers being second cDNA species using heel portions of the second heeled primers being such that the reverse transcribed first strand cDNA species are capable of hybridizing to at least one second primer. The processes can be used for expression profiling of single cells. The polynucleotide comprising an oligo d(T) sequence and a heel sequence 5, can be used for the reverse transcription of mRNA species in a sample. The polynucleotide primer population of claim (4) can be used for the synthesis of second strand cDNA libraries can be made for subsequent detailed analysis of gene expression and the
in a microorganism, particularly human immune deficiency virus or with cancer or a genetic disease (or susceptibility to it) in humans, but more generally can be used to detect mutations in RNA or DNA from animals, plants or microorganisms. By selecting a primer that binds adjacent to her specific site, variations at this site can be detected following incorporation of only a single dNTP. The method requires only a few, simple manipulations, making is suitable for routine use, and allows quantification of the proportion of mutated calls in a mixed population, down to 0.5% of this population. The method is easily automated. This sequence represents a PCR primer used to detect a mutation in the human K
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Reverse transcription of mRNA species used for expression profiling of single cells by employing a first heeled primer to provide first strand cDNA species and then a second heeled primer population to generate

This sequence is an antisense oligonuclectide of the invention. The antisense oligonuclectides are targeted to a nucleic acid encoding a cellular adhesion molecule (CAM) and is capable of modulating the expression of the CAM. They particularly inhibit intercellular adhesion molecule-1 (ICAM-1), vascular cell adhesion molecule-1 (VCAM-1), or endocherial leukocyte adhesion molecule-1 (ELAM-1). The antisense oligonuclectides can be used to modulate CAM activity in mediating cell:cell interactions and subsequent cellular and biological responses,

tumour suppressor I (WTSI) gene (AAAIII65). The variants have the following changes relative to this sequence: A at any of positions 265, 442, 330 and 329; T at any of positions 172, 238, 341 and 148 and deletions of nucleotides 290-294, 172-179 or 128-129. The variants are sometic mutations of MSTI, indicative of predisposition to melanoma and many other cancers, so detecting them is useful for diagnosis, prognosis and monitoring of cancer (including prenatal analysis). Cells and animals that express the variants are useful as model systems for identifying potential anticancer agents. This sequence represents a primer used to screen for the mouse MTSI Elbeta sequence
The invention relates to variants (AAA11196-A11206) of the human multiple

antisense sequences can be used for modulating the synthesis of a CAM.

They can be used for treating an animal suspected of having or being

They can be used for treating an animal suspected of having or being

prome to a disease or condition associated with a CAM. Oligonucleotides

targeted to ICAM-1 can be used for treating an inflammatory disease or

condition e.g. inflammatory bowel disease such as Crohn's disease or

condition e.g. inflammatory bowel disease such as Crohn's disease or

condition e.g. inflammatory bowel disease such as Crohn's disease,

condition e.g. inflammatory arthritis, allograft rejection, cancer,

pneumonia, multiple sclerosis or a viral infection. The ICAM-1 sequences

can also be used for reducing corticosteroid use in a patient or for

reducing cyclosporine use in a patient. The oligonucleotides can also be

used for detection and disgnosis. They can also be used for treating e.g.

chyproliferative disorders, tumours, diapedesis, graft versus host

disease, arthritis, infections, autoimmune disorders, e.g. autoimmune

thyroid disorders, autoimmune forms of arthritis, multiple sclerosis,

some forms of juvenile disbetes mellitus, mysathenia gravis, pemphigus

culgaris, systemic lupus erythematosus, cardiovascular disorders,

myocardial ischaemia/reperitusion injury, dilated cardiomyopathy, acute

myocarditis, ischaemic heart disease or stroke
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention provides a novel method for typing genes, particularly human leukocyte antigen (HLA) coding sequences. The methouses DNA sequences and a taxonomy-based sequence analysis method to assign alleles for HLA-DQA1, HLA-DQB1 and HLA-DRB. These alleles have been linked to diseases auch as diabetes, IgA deficiency, multiple sclerosis, cancer, clinical and immunological manifestations of HIV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Typing polymorphic genes, useful to assess the association of alleles with diseases and in disease diagnosis, uses a taxonomy based sequence analysis in which a typing tree based on distinguishing sequences is constructed.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        .

The present invention provides a novel method for typing genes, particularly human leukocyte antigen (HLA) coding sequences. The method uses DNA sequences and a taxonomy-based sequence analysis method to assign alleles for HLA-DQA! HLA-DQBI and HLA-DRB. These alleles have been linked to diseases such as diabetes, IgA deficiency, multiple sclerosis, cancer, clinical and immunological manifestations of HIV infection, coeliac disease, idiopathic nephrotic syndrome, immune responses to parasite antigens, pemphigus vulgaris, inflammatory bowel disease, rheumatoid arthritis, allergy and other inflammatory diseases Sequence 20 BP; 3 A; 6 C; 6 G; 5 T; 0 U; 0 Other;

/note= "All bases are phosphorothioate deoxynucleotides.
Optionally labelled at 3' end with fluorescein or at 5'
end with biotin" The present invention relates to an aggregated composition comprising a polypeptide having the transport function of herpesviral transport protein VP2. The aggregates can be useful for delivery of notes oligonucleotides and proteins into cells. The present sequence is one such oligonucleotide which may be delivered into cells using the method of the present invention. The aggregated composition is useful for preparing medicament for therapy or prophylaxis of a disease and for delivering molecules to cells in vitro. The aggregates are delivered to target cells such as tumour cells in vitvo and are useful for treating pooriasis, eczema or skin cancer Aggregated composition suitable for phototherapy or prophylaxis of psoriasis, eczema or skin cancer and for delivering nucleic acids and proteins into cells, comprises transport protein VP22 and an Gaps ö 0.8%; Score 13.6; DB 1; Length 20; 30.0%; Pred. c-raf is a serine-threonine-specific protein kinase and is thought to play a fundamental role in signal transduction, and cell proliferation control. The present sequence is an antisense oligomuclectide. This sequence is targeted to human c-raf gene, resulting in c-raf expression inhibition. The present sequence may be useful for treating and rafsociated cell hyperproliferation conditions such as cancer, hyperplasias, pulmonary fibrosis, angiogenesis, psoriasis, and emocht muscle cell proliferation in blood vessels etheroselerosis and emocht muscle cell proliferation in blood vessels e.g. stenosis or restenosis following angioplasty. Also, the present sequence may be useful for treating inflammatory disorders such as tissue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Interleukin 1 receptor antagonist short tandem repeat primer SEQ ID NO:7.

The present invention describes a method for predicting susceptibility to HIV infection or HIV progression in a subject. The method involves detecting a polymorphism in a human interfleakin-10 (Li-10) promoter, where the presence of the polymorphism indicates susceptibility to HIV infection or HIV progression. The method provides prognostic information or treatments (such as administration of II-10 or gene therapy with II-10). The presence of polymorphism is useful to thelp select treatment could substantially eradicate the virus from the infected person. The method is useful for the generation of normograms or other predictive algorithms that can be used, in association with allele status, to prognose probable survival or years to development of AIDs following HIV seroconversion. It indicates that increased expression of the IL-10 gene helps to reduce HIV-1 infection and pathogenic progression of the HIP disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Cell cycle regulation; corn; transgenic plant; cyclin; maize; soybean; cyclin-dependent kinase; sunflower; sorghum; canola; wheat; alfalfa; cotton; rice; barley; millet; ss.
                                                                                                                                                                                                                       Predicting susceptibility to HIV infection or progression useful for selection of therapeutic treatment for persons infected with HIV virus, comprises detecting polymorphism in human interleukin-10 promoter.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               of HIV disease. The present sequence represents a short tandem repeat (STR) primer which is used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

polymucleotide sequences AAC831101 - AAC83113 encode proteins AAB35794 -
AAB35806 which are involved in regulating the cell cycle. The protein and
DNA sequences have been isolated from Zea mays (corn), and the invention
also includes oligomucleotides AAC83114 - AAC83139 which are related to
the cell cycle polymucleotides. The cell cycle polymucleotide sequences
are useful for producing transgenic plants such as maize, soxphean,
care useful for producing transgenic plants such as maize, barley and
milet with increased levels of cell cycle gene activity, such as
activity of cyclin and cyclin-dependent kinases. The DNA sequences are
also useful as probes for detecting deficiencies in the level of mRNA in
screening for desired transgenic plants, for detecting mutations in the
gene, for monitoring upregulation of expression or changes in enzyme
activity in screening assays of compounds, for detecting any number of
allelic variants, orthologs or paralogs of the gene, and site-directed
mutagenesis in eukaryotic cells. The DNA sequences are also useful for
recombinant expression of the encoded polypeptides and as immunogens for
preparing and screening antibodies. A transgenic plant comprising an
copiession cassette including a cell cycle regulatory gene is useful for
assaying enzyme agonists and antabodies are useful in assaying expression
cobtain antibodies. The antibodies are useful in assaying and isolating
nucleic acids from expression lifer identifying and isolating
nucleic acids from other species, and for identifying and isolating
properties from expression in the species, and for identifying and isolating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Antisense oligonucleotide; p38 mitogen activated protein kinase; MAPK; antirheumatic; antiarthritic; immunosuppressive; cardiant; heart disease; antiinflammatory; autoimmune disease; rheumatoid arthritis; apoptosis; phosphorothioate; ss.
                                                                                           Nucleic acids useful for producing transgenic plants, preferably maize, with increased cell cycle gene activity, preferably activity of cyclin and/or cyclin-dependent kinase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   0.8%; Score 13.6; DB 1; Length 20; ilarity 80.0%; Pred. ```
This invention relates to antisense compounds 8-30 nucleobases in length targeted to the 5'-untranslated region, translational start site, translational termination region or 3'-untranslated region of a nucleic acid encoding a p38 mitogen activated protein kinase (MAPK), where the antisense oligonucleotides inhibit the expression of MAPK. Sequences AAC79480 and AAC79501 represent human p38alpha MAPK and p38beta MAPK CDNA sequences. AAC79501 represent human p38alpha MAPK and p38beta MAPK CDNA p38alpha antisense oligonucleotides, while AAC79502 - AAC7951 and antisense oligonucleotides, while AAC79502 - AAC7951 and antisense oligonucleotides, AAC79534 sequence AAC79523 and antisense oligonucleotides AAC79533 - AAC79536 isolated from rat tissue. Wurine p38beta MAPK CDNA is represented in AAC79537 and antisense oligonucleotides Aeve antisheumatic, antisthritic, The antisense oligonucleotides have antishing the expression of $38 MAPK in cells or tissues. The oligonucleotides are useful for inhibiting the expression of $38 MAPK in cells or tissues. The oligonucleotides are used for treating an animal continities, or heart disease. The oligonucleotides are used for treating an animal continities, or heart disease. The oligonucleotides are also useful for thinkities.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                NPRS; non-ribosomal peptide synthetase; adenylation domain; A domain; PCR primer; antiblotic; immunosuppressant; cytostatic; antiviral; antihelminthic; fungicidal; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

The present invention describes a method of modulating bone resorption comprising administering leptin or a derivative under conditions suitable for the modulation of osteoclastogenesis. This is useful in the treatment of osteoporosis and paget's disease. No further information about this
                                                                                                                                                               This invention describes a novel method for the targeted non-ribosomal synthesis of peptides (I) of required structure, comprising altering one or more A (adenylation) domain-encoding DNA segments (II) that encodes a non-ribosomal peptide synthetase so that the expression product of the altered (II) can produce (I), is new. Alterations in the A-domains are made according to a non-ribosomal code reproduced in the Specification. The method is used to synthesize (I) with antibiotic, immunosuppressant, cytostatic, antiviral, antihelminthic, fungicidal or surface-active properties, and to alter specificity and/or activity of known piologically active compounds, e.g. to improve their solubility by replacing hydrophobic amino acids with hydrophilic ones, or vice versa. AAA97960-A97995 represent PCR primers used to illustrate the method of the invention. (Updated on 15-SEP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Modulating bone resorption in human or animal for treating osteoporosis or Paget's disease, comprises administering leptin, its derivative, homologue, analog, chemical equivalent, antagonist or agonist.
                                            Non-ribosomal synthesis of peptides, e.g. antibiotics or immunosuppressants, using non-ribosomal peptide synthase with targeted modifications in adenylation domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Bone resorption modulation; leptin; osteoporosis; Paget's disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Bone resorption modulation method related sequence SEQ ID NO: 1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Ouery Match 0.8%; Score 13.6; DB 1; Length 20; Best Local Similarity 80.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to an antisense compound 8 to 30 nucleobases in length targetted to a nucleic acid encoding glycogen synthase kinase 3 alpha. The antisense compound specifically hybridises with and inhibits the expression of glycogen synthase kinase 3 alpha. The antisense compound is useful for the treatment of a diseases associated with glycogen synthase kinase 3 alpha such as diabetes, a neurological disorder, a haematopoietic disorder, a hyperproliferative disorder or a developmental disorder. The antisense compounds may also be used prophylactically to prevent or delay infection, inflammation or tumour formation. The present sequence is a phosphorothicate antisense oligonucleotide targetted to human glycogen synthase kinase 3 alpha DNA
                                                                                                                                                                                                                                                                                                                        Antisense compound 8 to 30 nucleobases in length comprising a compound that is targeted to a nucleic acid molecule encoding glycogen synthase kinase 3 alpha, useful for the treatment of e.g. diabetes and hyperproliferative disorders.

The present invention relates to an analytical support, to which a number of oligonucleotides are fixed. The oligonucleotides are labelled with a fluorescent compound, the fluorescence of which varies when the oligonucleotide hybridises to its complement. The analytical support is useful in hybridisation testing for identification of specific nucleic acids, such as genomic sequencing, detecting mutations or pharmaceutical development. The present oligonucleotide was used to illustrate the
                                                                                                                                                                                                                                  Support for hybridization analysis of nucleic acids for sequencing techniques, comprises an array of oligonucleotides having a label where the fluorescence changes follow hybridization.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human bcl-6 phosphorothioate antisense oligonucleotide, SEQ ID NO:41.

Sequences AAC81144-C81223 represent antisense oligonucleotides targetted to the human bcl-6 gene, which inhibit its expression. The antisense oligonucleotides were designed to target different regions of the human bcl-6 mRNA, and were analysed for their effect on bcl-6 mRNA levels by quantitative real-time PCR. Bcl-6 (also known as B-cell CLL/ lymphoma 6, clinc finger protein 51 and iAZ3) is a sequence-specific DNA-binding transcriptional repressor. The bcl-6 gene is expressed in germinal centre B- and T- cells and is required for germinal centre formation and Th-2 mediated antibody affinity maturation. Bcl-6 may also play a role in the regulation of apoptosis. The bcl-6 gene is located on chromosoma 3q27, a region which undergoes a high frequency of translocation events. Such chromosomal translocations can result in abserrant forms of bcl-6, which are strongly implicated in the pathogensis of several types of lymphoma, and have also been reported in acute lymphoblastic leukaemia and post-transplant lymphoproliferative disorders. The oligonucleotides of the conditions associated with aberrant forms of bcl-6, such as lymphomas, acute lymphoblastic leukaemia and post-transplant lymphoblastic leukaemia and post-transplant lymphoblastic leukaemia and post-transplant lymphoblastic leukaemia and post-transplant lymphoproliferative
          Antisense compounds which specifically hybridize with and inhibit human bcl-6 expression, useful for treating bcl-6 related disorders, and preventing or delaying inflammation or tumor formation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel multiple tumor suppressor gene useful for diagnosing, prognosing and treating cancers, such as melanoma, leukemia, glioblastoma and

                                                                                            The invention relates to antisense oligonucleotides, compositions and methods for modulating cot oncogene expression. The cot oncogene is also known as Tpl-2 and est. The compositions comprise antisense compounds, particularly antisense oligonucleotides, targetted to nucleic acids encoding cot oncogene. The antisense oligonucleotides are useful for associated with expression of cot oncogene and for treating diseases associated with expression of cot oncogene, e.g. inflammation, cancer or disorders of the immune system. The antisense oligonucleotides are also useful for diagnosis or prophylaxis or as research reagents and kites. The present sequence is human cot oncogene antisense oligonucleotide, ISIS 116381. This sequence was targetted towards the coding region of human
expression of cot oncogene, such as inflammation, cancer or immune system disorders.
                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       note= "All cytidine residues are 5-methyl cytidine"

                                                                                                                                                                                     The invention relates to antisense oligonuclectides targeted to human PARP nucleic acid and inhibiting expression of human PARP. PARP (Poly (ADP-ribose) polyaerase plays an important role in chromatin decondensation, DNA replication, DNA repair, gene expression, malignant transformation, cellular differentiation and apoptosis. The antisense oligonuclectide inhibitors are useful for inhibiting the expression of PARP in human cells or tissues. They are also useful for treating a human with a disease associated with PARP especially hyperproliferative disorders (e.g. cancer), cellular injury resulting from oxidative stress, neurological (e.g parkinsonism, meningitis-associated intracranial complications and isotheemia), inflammatory and autoimmune disorders (e.g. arthritis) and diabetes. The present sequence is an antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; ss; PARP; Poly (ADP-ribose) polymerase; antisense oligonucleotide; cytostatic; nootropic; neuroprotective; antilnflammatory; antidiabetic; immunosuppressant; hyperproliferative disorder; cancer; cellular injury; oxidative stress; neurological disorder; parkinsonism; apoptosis; meningitis-associated intracranial complication; ischaemia; probe; inflammatory disorder; autoimmune disorder; arthritis; diabetes.
                                                                                                          Antisense compound useful for treating hyperproliferative, neurological, inflammatory and autoimmune disorders and diabetes inhibits human PARP.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   mod_base= OTHER

The invention relates to antisense oligonuclectides targeted to human PARP nucleic acid and inhibiting expression of human PARP. PARP (Poly decondensation) therease polyays an important role in chromatin decondensation, DNA replication, DNA repair, gene expression, malignant transformation, cellular differentiation and apoptosis. The antisense oligonuclectide inhibitors are useful for inhibiting the expression of PARP in human cells or tissues. They are also useful for traating a human with a disease associated with PARP especially hyperproliferative disorders (e.g. cancer), cellular injury resulting from oxidative stress, neurological (e.g parkinsonism, meningitis-associated intractanial complications and isolaemia), inflammatory and autoimmune disorders (e.g arthritis) and diabetes. The present sequence is an antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human hnRNP A1 phosphorothioate antisense oligonucleotide, SEQ ID NO:46.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human hnRNP A1; heterogeneous nuclear ribonucleoprotein A1; heterogeneous nuclear ribonucleoprotein core protein A1; p40CRS; mRNA processing; transport; stabilisation; alternative splicing; donor splice site selection; telomere biogenesis; oncogenesis; apoptosis-associated protein; cancer; tumour formation; expression inhibition; phosphorothioate; antisense oligonucleotide; ss.
                                                                                                                                                                                                                                                            Antisense compound useful for treating hyperproliferative, neurological, inflammatory and autoimmune disorders and diabetes inhibits human PARP.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 0.8%; Score 13.6; DB 1; Length 20;

cotheres AAC92738-C92817 represent antisense oligonucleotides targetted to the heterogeneous nuclear ribonucleoprotein A1 (hnRNP A1) gene, which to the heterogeneous nuclear ribonucleotides were designed to target different regions of the human hnRNP A1 mRNA, and were analysed for their effect on hnRNP A1 mRNA levels by quantitative real-time PCR. CnRNP A1 alac Anoma as heterogeneous nuclear ribonucleoprotein core protein A1 and p40CRS) is thought to function in the stabilisation, transport and processing (including alternative splicing) of newly transport and processing (including alternative splicing) of newly transport and processing (including alternative splicing) of newly and shuttles continuously between the nucleus and the cytoplasm acting as a carrier protein for mRNAs. In Alaps participates in telomere biogenesis, with low levels of hnRNP correlating with shortened biogenesis, with low levels of hnRNP correlating with shortened corrected procein on the basis that it is specifically cleaved into three fragments during antichody-mediated apoptosis. Due to its ability to three fragments during antichody-mediated apoptosis. Due to its ability to three fragments during antichody-mediated apoptosis. The invention are useful for diagnosis, prevention and treatment of conditions associated with hnRNP A1 expression, such as cancer

This invention describes a novel conjugate (I) which consists of (A) a molecule to be transported and (B) at least one aryl residue of formula - CC Ar. (xc(Y)-H) n (II). Ar = group containing at least one aroatic ring; X = 0 or N (Bic); Y = 0, So N MH-R 2 (Sic); R, I = optionally substituted (CC 1-23C alkyl (optionally substituted 1-18C alkyl (optionally containing double and/or triple bonds); R\_2 = coping containing double and/or triple bonds; R\_2 = coping containing double and/or criple bonds; R\_2 = coping (B) is integer of 1 or more. (A) is bonded to (B) directly or via a chemical group, provided that the chemical group is other than CH\_2 coping (B) is to peopration of a conjugate (I) of (A) a molecule to be transported and (B) at least one aryl residue (not restricted to at which (B) is to be bonded, preparing (B) and reacting (A) and (B); at least one aryl residue (not restricted to at which (B) is to be bonded, preparing (B) and reacting (A) and (B); at least one aryl residue (not restricted to at which (B) is to be bonded, preparing (B) and reacting (A) and (B); at least one aryl residue (not restricted to coping (II)) (optionally bonded via a chemical coping (II)) (optionally bonded via a chemical coping (II)) (optionally bonded via a chemical coping and antiasthmatic activity and can be used for generating (B) across biological membranes or into eukaryotic or proxing (I) are antisened for generating (I) are also claimed. Typically (I) are antisened coping (I) are also claimed. Typically (I) are antisened coping (II) are also claimed. Typically (II) are allowing or colling (C) hybridization. Conjugates (II) and prepared viewing (II) are allowing coping coping or asthma); or colling viral infections or diseases associated with integring or (II) and mich case the conjugates (II) are fluorescently labeled, allowing conficuring of callular uptake etc. The callular uptake of (II) are subtaked to conjugates (II) are subtaked for conjugates (II) are subtaked (II) are subtaked (II) are subtaked (II) are subtake ) e.g. oligonucleotides conjugated with fluorescein diacetate (v scope of (B)) have superior uptake to corresponding fluorescein New substituted aryl conjugates of parent molecules, especially oligonucleotides, having improved transmembrane and intracellular transport properties, useful as medicaments or diagnostic agents. 0.8%; Score 13.6; DB 1; Length 20; 80.0%; Pred. The present sequence is mouse secreted Frizzled-related protein (sfrp3) gene specific reverse transcription PCR (RT-PCR) primer. The invention relates to a method for treating or preventing chronic obstructive pulmonary disease (COPD) such as emphysema, asthma and chronic bronchitis in a subject. The method involves administering to the subject, an agent effective to inhibit apoptosis by inhibiting the expression of a secreted Prizzled-related protein (sFRP) gene. It is also useful in antisense

Inhibition of apoptosis for the treatment or prevention of obstructive pulmonary disease comprises inhibiting expression of secreted Frizzled-related protein gene in lung cells.

The sequence represents PCR primer RP.2(rev) used in analysis of multiple tumour suppressor MTS1 and MTS2. The MTS genes, and expression products, are useful for treating, diagnosing or prognosing human cancer. In particular, the MTS gene is useful for diagnosing a predisposition to or as a gene therapy for melanoma, leukaemia, astrocytoma, glioblastoma, lymphoma, chronic lymphatic leukaemia (CLL), or cancers of the pancreas, breast, thyroid, ovary, uterus, testis, kidney, stomach or rectum. The gene may be used in both cancerous and pre
relates to a method for treating or preventing chronic obstructive pulmonary disease (COPD) such as emphysema, asthma and chronic bronchitis in a subject. The method involves administering to the subject, an agent effective to inhibit apoptosis by inhibiting the expression of a secreted Frizzled-related protein (8FRP) gene. It is also useful in antisense

The sequence represents an FITC (fluorescein isothiocyanate) labeled cligonucleotide complimentary to part of the mRNA encoding the intracellular-adhesion molecule ICAM. The oligonucleotide is included in a composition comprising a fusion protein of herpes virus VP22 protein 159-301 (laving the transport function) and a cell-cycle progression regulator (or its DNA) e.g. BH3 or apoptotic proteins. The composition is used to reduce the proliferation of cells. The method of making the VP22 containing compositions is used for reducing proliferation of hyper-proliferating cells e.g., cancer cells, for manufacturing a medicament to reduce or treat cell proliferation e.g. cancer cell proliferation. The method is also used for reducing or treating cell proliferation. The method is also used for reducing or treating cell proliferation, in tumour cells present in tumour cells marts, smooth muscle cells present in restencist, proliferating skin cells e.g., skin cancer, psoriasis or cetema skin cells, or proliferating cells of scar tissue
                                                                                                                                                                                                                                                                                       apoptosis; hyper-proliferating cell; cancer; tumour; eczema; cell-cycle progression regulator; genital warts; restenosis; skin cancer; psoriasis; scar tissue; intracellular-adhesion molecule.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Inhibiting cancer cell proliferation by exposing cells to a composition of fusion proteins comprising VP22 polypeptides coupled to cell cycle progression regulators, and further exposing cells to cell death

The primers are used in the method of the invention. The specification describes a method for screening genetic diseases. The method comprises using DNA simply extracted from a biological specimen such as scraeped mucosal cells and tissue slide pieces fixed with formalin and embedded in paraffin, and amplifying a target region by polymerase chain reaction (PCR) for direct fluorescence measurement of the additional doublestranded DNA intercalator. The method is used for detecting gene anomaly in e.g. infections diseases, congenital genetic diseases or cancers, including infection disease due to human papilloma virus and chlamydia genetic diseases like cystic fibrosis, mitochondrial cerebromyopathy, cancers of cervical cancer and colon cancer, through gene diagnosis in community screening test program ö Gaps .. 0.8%; Score 13.6; DB 1; Length 20; 80.0%; Pred. The present invention relates to a method for stimulating an immune response. The method comprises administering an immunostimulatory nucleic acid to a non-rodent subject in sufficient quantity to stimulatory nucleic acid to a non-rodent subject is one such immunostimulatory nucleic acid. The immunostimulatory nucleic acids can be pyrimidine rich (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects against tumour antigens, viral antigens (e.g. herpesviridae, retroviridae and/or orthomyxoviridae), bacterial antigens (e.g. herpesviridae, retroviridae and/or orthomyxoviridae), clostridium, Escherichia coli and/or staphylococcus), fungal antigens and/or parasitic antigens. The method is also useful for preventing cancer, asthma, infectious disease, allergy or immune deficiency. The present sequence can also be used to redirect a thi temune response and to activate immune cells. Note: the present sequence may have a phosphorothioate backbone
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

```
The present invention describes bases in the shape of a string, tape or circular disc on the surface of which a plural number of different ligands are immobilised respectively in pre-determined domains. Also described are devices for detecting the binding between the ligands and receptors and methods for detecting the binding between the ligands are useful for detection in biochemical and diagnostic assays. The ligands are immobilised in line, so the user only needs to determine the presence or absence of receptor binding, without further processing. AAM411315 represent primers which are used in an example from the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Antileukoprotease, ALP; secretory leukocyte proteinase, SLPI; human; cancer marker; ovarian tumour; ovarian-derived metastatic tumour; overexpression; low malignant potential tumour; ovarian carcinoma; serous carcinoma; mucinous carcinoma; endometrioid carcinoma; elear cell carcinoma; cancer; diagnosis; cytostatic;
                                                                                                                                                                                                                             String, tape or disk shaped bases with several different immobilized ligands including nucleic acids, sugars, peptides and proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human antileukoprotease (ALP) reverse PCR primer, SEQ ID NO:4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 20 BP; 5 A; 5 C; 3 G; 7 T; 0 U; 0 Other;

The invention relates to methods for the diagnosis and treatment of ovarian tumours or ovarian-derived metastatic tumours in an individual.

The diagnostic method involves measuring the level of antilenkoprotease (ALP) in a sample (e.g., a blood sample, tissue biopsy or ovarian secretion) from an individual. If the level of ALP exceeds the mean basal secretion from an individual is likely to have an ovarian or ovariance of ALP in non-diseased individuals by 2 or more standard derived tumour. ALP, also known as secretory leukocyte proteinse (SLPI), derived tumour. ALP, also known as secretory leukocyte proteinse (SLPI), is a small (approximately 100 amino acids) secreted proteinse (SLPI), is a small (approximately 100 amino acids) secreted proteinse (SLPI), enzyme, and is also able to inhibit leukocyte elastise, cathepsin G, chymotrypsin and trypsin. It is significantly overexpressed in carcinomas and potential tumours of coarian-derived tumours, or preventing covarian tumour metastasis, via the administration of ALP. Methods of the overian and overian-derived metastatic tumours, particularly low malignant potential for the diagnosis, prevention and reactinoma, consinual endometricing carcinoma, endometricing carcinoma, endometricing carcinoma, endometricing carcinoma, endometricing carcinoma, endometricing carcinoma and clear cell carcinoma.

Sequences AAH23847-AAH23850 represent PCR primers used in quantitative consinual and cancerous ovarian tissue determine levels of ALP.

human excitatory amino acid (EAA) 5 receptor. The synthesis this central nervous system (CNS) receptor in vivo is regulated by an editing mechanism. This editing results in the expression from a single human CNS receptor game of structurally distinct forms of the CNS receptor protein. The specification describes a human EAA4 receptor. The human excitatory EAA4 receptor polymuclacotide and the protein it encodes are useful for screening potential therapeutic compounds and selecting drug candidates that interact selectively with edited human central nervous system

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention describes novel regulatory sequences (A) derived from human fassin that provide specific expression in dendritic cells (DC) and which have antiviral, antibacterial, antifungal, antiparasitic, anti-allergic, neurological, immunomodulatory and apoptotic activity. (A) are used to regulate expression of antigens, immunoregulators, antisense sequences etc. in DC-specific fashion. Recombinant DNA, vectors and host cells that contain (A) are useful: (i) in vaccines against viruses. bacteria, fungi, parasites, tumors, allergens and plaques in Creutzfeld-akoko and Alzheimer's disease; and (ii) for gene therapy of tumors, allergies, infections, autoimmune diseases and transplant rejection. They can also be provide specific expression of antigens and immunoregulators
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New regulatory sequences from the fascin gene, useful for providing dendritic cell-specific expression of e.g. antigens, e.g. for vaccination against tumors and infections.
including gene therapy, protein replacement therapy, and protein mimetics. The MTS sequences are useful for diagnosing predisposition to human cancer or for diagnosing and prognosing human cancers such as melanoma, leukaemia, astrocytoma, glioblastoma, lymphoma, glioma, Hodgkin's lymphoma, CLL and cancers of pancreas, breast, thyroid, ovary, uterus, testis, kidney, stomach and rectum. They are also used for screening drugs for cancer treatment. The present sequence is pl6-specific reverse PCR primer used for amplifying mouse Pl6beta cDNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                antibacterial; antifungal; antiparasitic; anti-allergic; neurological; immunomodulatory; apoptotic; expression regulator; vaccine; allergen; Creutzfeld-Jakob disease; Alzheimer's disease; gene therapy; autoimmune disease; transplant rejection; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Fascin; regulatory sequence; human; dendritic cell; antiviral; tumor;

```
A new protein is described which comprises the 318 residue amino acid sequence corresponding to wild type retinol dehydrogenase (RDHS), but where amino acid 238 is not Gly, amino acid 73 is not Ser, or amino acid 33 is not Ile. This mutant RDHS can be used in the analysis of mutations in the gene encoding retinol dehydrogenase, in the diagnosis and treatment of ocular diseases associated with retinal degeneration such fundus albipunctatus. Other disorders which may also be studied include retinitis punctar albescens, albipunctate dystrophy and retinitis pigmentosa. A number of primer pairs (See GENESEQ records AAA5443). A54448) were used to amplify the genomic RDHS DNA. Two primers (AAA54441, AAA54442) were used to amplify exon 3b of the RDHS gene. This primer corresponds to nucleotides 3151-3170 of the genomic DNA sequence (See GENESEQ record AAA5441).
in DC; for isolation and identification of cell factors and cis-elements from regulatory sequences that mediate DC-specific expression; to determine the degree of maturity of DC and to block transcription factors, by providing binding sites in DC. (A) provide DC-specific expression of nucleic acid under their control, allowing a more specific regulation of the immune response and eliminating the long and laborious purification of DC (since a complete leucocyte population may be transformed), including transformation in vitro. This sequence represents a primer associated with the human fascin gene described in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Mutations in nucleic acid molecules encoding 11-cis retinol dehydrogenase correlated to ocular disorders, useful in diagnosis and treatment of diseases such as fundus albipunctatus.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New multiple tumor suppressor 2-specific antibodies useful for detecting differences in the absence of the peptides or mutant gene products, or for screening tissues.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to an antibody or its fragment that specifically binds to a human multiple tumour suppressor (WTS). The invention is useful for detecting differences in the absence of MTS peptides, to screen a tissue or to detect mutant MTS gene products. The antibodies will immunoprecipitate MTS proteins from solution as well as react with MTS protein on Western or immunoblots of polyacrylamide gels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

The specification describes a method for detecting a mutation at a particular position in a target nucleic acid. The method comprises binding the target to a solid support, hybridizing a probe to the target, elongating the probe with nucleotide(s) resistant to exonuclease, digesting the probe with accounclease and detecting bound nucleic acid. The mutation is in position 'n' in a target nucleic acid and the 3' extremity of the probe hybridises to position 'n'. The method is used to detect gene mutations implicated in disease, particularly hereditary thalassemias, cystic fibroais, hemophilia and genes implicated in cancer. The present sequence represents a probe which is used in the method of the invention to detect a mutation in codon 12 of K-ras
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human, phosphofructokinase isozyme-2; iPFK-2; therapy, drug screening,

The present invention relates to a method for screening a candidate therapeutic agent that inhibits kinase enzymatic activity of phosphofructoxinase isozyme (IPRA-2). Phosphofructoxinase catalyses the formation of fructose 2,6-biplosphate from fructose-6-phosphate. The method is used for identifying compounds that may be used to inhibit iPPR-2 activity, an enzyme that is over-expressed by cancerous cells. IPRK-2 is useful as diagnostic targets, drug screening targets and as antisense compounds that inhibit inflammation, cachexia and its translation in callular cyclosol as an anti-tumour treatment. The present sequence is human phosphofructoxinase isozyme (IPRK-2) DNA specific phosphorothicate (S-IPRF-2) used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human iPFK-2 DNA specific phosphorothioațe antisense oligonucleotide #1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human, phosphofructokinase isozyme-2; iPPK-2; therapy; drug screening;

The present invention relates to a method for screening a candidate therapeutic agent that inhibits kinase enzymatic activity of phosphofructokinase isozyme (IPFK-2). Phosphofructokinase catalyses the formation of fructose 2,6-biphosphate from fructose-6-phosphate. The method is used for identifying compounds that may be used to inhibit iPFK-2 activity, an enzyme that is over-expressed by cancerous cells. IPFK-2 is useful as diagnostic targets, drug screening targets and as antisense compounds that inhibit inflammation, cachexia and its translation in cellular cytosol as an anti-tumour treatment. The present sequence is human phosphofructokinase isozyme (IPFK-2) DNA specific phosphorothioate antisense oligonucleotide (AS-IPFK-2) used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Solute carrier family 6 neurotransmiter transporter; sectonin 4; SLC6A4; genotyping; allele specific oligonuclectide; ss.

PCR primer used to amplify cDNA encoding a rat mu-subtype opioid receptor. The polynucleotide sequence is useful for producing a mu-type opioid receptor by standard recombinant techniques. The encoded protein is useful for producing monoclonal or polyclonal anti-receptor antibodies and to identify patterns of post-translational modifications and to elucidate associated G proteins. Wu receptor polynucleotides and solypeptidas are useful in identifying other receptor subtypes, in screening for new opioid ligands and for understanding mechanisms of opioid action e.g., drug addiction
                                                                                                                                                                                                                                                                                          ö
                                                                  The present invention relates to a polymorphic variant of a reference sequence for the solute carrier family 6 neurotransmitter transporter, serotonin member 4 (SLC6A4) gene or a fragment of it or a sequence complementary to the first sequence. The invention is used in producing a recombinant organism that can be used to express SLC6A4 for protein structure analysis and binding studies. A composition comprising a genotyping oligonucleotide is used to detect a polymorphism in the SLC6A4
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel isolated DNA encoding mu-subtype opioid receptor protein which is useful for identifying other receptor subtypes, screening for mu opioid ligands and for understanding mechanisms of opioid action.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Primer used to amplify cDNA encoding rat mu-subtype opiate receptor.

New DNA-peptide nucleic acid chimeras, useful e.g. as antisense agents for treating e.g. cancer, also as diagnostic probes and primers.

Disclosure; Page 24; 54pp; German.

This invention describes novel polyamide-oligonucleotide derivatives (I) and their physiologically acceptable salts of formula P((DNA)-Li)\_g(PNA-CCCC) and their physiologically acceptable salts of formula P((DNA)-Li)\_g(PNA-CCCC) and their physiologically acceptable salts of formula P((DNA)-Li)\_g(PNA-CCCC) and their physiologically acceptable salts of two or more adjacent lefters at least 2; x = 1-20; DNA = mucheic acid cuch as DNA or RNA or their known derivatives); Li = covalent linkage between DNA and PNA, i.e. a bond or a residue containing at least one nucleobase different from thymins; and F. F. = containing at least one nucleobase different from thymins; and F. F. = and groups and/or are connected through a covalent bond. The products of the invention have anticaneer, antipoliferative, antiviral, hepatotropic and vasotropic activity and can be used for the inhibition of gene expression by antisense, ribozyme, sense, or triple-helix methods, or by viruses (human immune deficiency, herpes simplex, influenza, vesicular stomatitis, hepatitis B or papilloma), or mediated by integrins or cell-celtenosis particularly as antisense reagents. They are also useful in heterogeneous or homogeneous assays, as primers or probes, particularly where the target is amplified before being deceted by hybridization, for the increased affinity for complementary strands and better stability in the increased affinity for complementary strands and better stability in the disadvantages, i.e. have improved cellular uptake, do not aggregate in aqueous solution, and have reduced affinity for purification are requence specificity. They are

more active than either DNA or PNA oligomers. When used as probes, (I) show different responses to base-pair mismatches in the DNA and PNA segments, allowing better discrimination between pathogenic and non-pathogenic conditions such as the transition from proto-oncogene on conceptus, also, when used as primers, with the PNA segment at the 5'-end, they produce amplicons resistant to 5'-exonuclease, allowing this enzyme to be used to eliminate RNA or DNA primers. The DNA component allows additional reactions not possible with PNA alone, e.g. 3'-tailing and (I) may be incorporated into a gene. AAH49208-AAH49264 represent oligonucleotides used to illustrate the method of the invention 888888888888888

Identifying a nucleic acid having a sequence capable of targeting a gene of interest, for identifying nucleic acids for gene therapy, comprises using the Nearest-Neighbor Thermal Stability Program.

Example 1; Col 21-22; 43pp; English.

The present invention describes a method for the identification of a nucleic acid having a sequence capable of targeting a gene of interest comprises. (a) a first database having a list of stability values for independent combinations of N(x); (b) a computing unit having a means for inputting data comprising N(x), data list, defining a nucleic acid sequence of interest to be targeted to provide a second database, and (c) a program capable of processing the first and second database; and (c) a program capable of processing the first and second database to N(x) comparison, and a stability value of a nucleic acid sequence capable of targeting the gene of interest. The method is useful for identifying a nucleic acid having a sequence capable of targeting a gene of interest. The method may be used to obtain thermodynamic parameters for 20 combinations of nearest-neighbour base pairs of DNA:RNA hybrid sequences. The Nearest-Neighbour Thermal Stability Program can process data for use in

The present invention describes a method for the identification of a nucleic acid having a sequence capable of targeting a gene of interest comprises: (a) a first database having a list of stability values for independent combinations of N(x), (b) a computing unit having a means for inputting data comprising N(x), data list, defining a nucleic acid a geometrien, and a stability value of a nucleic acid database; and a stability value of a nucleic acid database to N(x) comparation, and a stability value of a nucleic acid database to N(x) argeting the gene of interest. The method is useful for identifying a nucleic acid having a sequence capable of targeting a gene of interest. The method is useful for identifying a nucleic acid having a sequence capable of targeting a gene of interest. The method way be used to obtain thermodynamic parameters for 20 combinations of nearest-neighbour base pairs of DNA:RNA hybrid sequences. The Nearest-Neighbour Thermal Stability Program can process data for use in calculating thermal melting temperatures for phosphorothicate DNA:RNA hybrids. The program can be readily extended to predict the most stable
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Antisense DNA oligomer, ASO; identification, gene therapy; target;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Identifying a nucleic acid having a sequence capable of targeting a gene of interest, for identifying nucleic acids for gene therapy, comprises using the Nearest-Neighbor Thermal Stability Program.
calculating thermal melting temperatures for phosphorothicate DNA:RNA hybrids. The program can be readily extended to predict the most stable triplex-forming sequences, or antigene oligomers. The present sequence represents a DNA 20-mer ASO (antisense DNA oligomer) sequence which is used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human intracellular adhersion molecule 1 (ICAM-1) S-ASO SEQ ID NO:15

triplex-forming sequences, or antigene oligomers. The present sequence represents an antisense DNA oligomer designated S-ASO targeted to the

```
The invention relates to Detecting a collagen gene alteration associated with a pathological condition in a human subject by obtaining from the subject a sample nucleic acid containing a portion of at least 15 consecutive nucleotides of the segment of the COLIA1 gene extending in the 5' to 3' direction from 78 nucleotides of intron 27 located adjacent exon 28 through the 3' end of intron 17, where the portion contains an intronic nucleotide and a first and second site, determining the sequence of the portion contains an intronic nucleotide and a first and second site, determining the sequence of the portion with the corresponding consensus sequence of the COLIA1 gene where a difference between the sequence of the portion and the consensus sequence indicates the presence of the collagen alteration in the subject. The method is used for detecting abnormalities in a COLI or COL9 gene is useful for determining whether a subject is afflicted with pathological conditions associated with an altered collagen gene such as osteoporosis, multiple epiphyseal dysplasia, osteogenesis imperfecta, shortness of stature and consumently in a collagen gene is also useful for designing a therapeutic nucleotide or gene therapy agent which can be administered to the subject to correct or alleviate the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 'note= "C is covalently linked to a fluorescein moiety"
                                                                                                                                                                                                                                                                                                                                                             VP22; viral protein 22; ss; cytostatic; antipsoriatic; dermatological; diaasgregating agent; Aluminium phthalocyanine; cell proliferation; apoptosis; psoriasis; eczema; skin cancer; restenosis; scarring; Intracellular-adhesion molecule; ICAM.
abnormality. The method is useful for detecting mutations in both the coding and non-coding sequences of any of the COLI or COL9 genes. Therefore the method can be used to detect colladen gene alterations which affect either the primary sequence of a collagen protein chain, splicing of the mRNA encoding such chains or regulation of expression the genes encoding such chains. The present sequence is a PCR primer which amplifies a nucleic acid from a collagen gene of the invention

cells to the aggregate composition cited above, which can promote disaggregating agent cited above, which can promote cells to the disaggregating agent cited above, which can promote disaggregation of the aggregate composition in cells, where steps (a) and (b) are carrier out simultaneously or sequentially. a product comprising the aggregate composition and the disaggregation of these components, either sequentially or together, a pharmaceutical comprising the aggregate composition and the disaggregating agent, in combination with a pharmaceutical excipient and a cell preparation obtainable by treating the target cells in vitro as cited in the method above. The aggregate composition and disaggregating agent are useful in the manufacture of a medicament for treating diseases or target cells, and/or preventing cell proliferation controllary, or xilling cells. These compositions, product or pharmaceutical are useful in therapy, particularly for manufacturing medicaments for useful in therapy, or as a medicament for delivering molecules to cells to prevent creating psoriasis, eczema, skin cancer, restenosis and scarring. The present sequence is an oligonuclectide encoding an intracellular-adhesion mached to the immedicament for manufacture of and scarring. The manufacture of the prevent creating psoriasis, eczema, skin cancer, restenosis and scarring. The mached to the immedicament for mached to demonstrate the mached to the property of the immedicament of the property of the immedicament of the mached to demonstrate the mached to the immedicament of the mached to the mached 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
prevent their proliferation and/or kill them comprising: (a) exposing the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            /note= "linked to one of the peptides shown in ABB04517 and ABB04518 to form a PNA-peptide conjugate"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             /*tag= a

New peptide nucleic acid derivatives, useful e.g. for tumor treatment and diagnosis, contain terminal, deprotonizable phosphoryl groups for e.g. improved solubility.
                                                                                                                                                                                    The present invention relates to peptide nucleic acid (PNA) derivatives having at the C., and optionally N., terminus one or more phosphoryl groups, at least one of which contains one or more deprotonisable groups, preferably hydroxy or mercapto. These PNAs are useful in the treatment of tumours or any disease associated with (over) expression of particular genes, including viral infections, vitiligo or other pigmentation disorders, and asthma. The present sequence is a peptide nucleic acid described in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 20 BP; 2 A; 14 C; 0 G; 4 T; 0 U; 0 Other;

Detecting infection of human herpes virus type or strain by informatic analysis of gene sequence using probe and primers capable of directing amplification of target sequence and interpolating the virus.

Claim 18; Page 35; 67pp; English.

The invention relates to detecting (MI) infection by human herpes virus (HIV) by performing informatics analysis of gene sequences from different HHV types or strains (e.g. HHVI-HHVS) to identify target segment (TS), selecting probe and primers capable of directing amplification, amplifying TS, interpolating HHV number by comparing number of amplification cycles (NAC) for detecting a segment of genomic viral DNA quantity of TS. Also included are cloning a segment of genomic viral DNA

C from the identified TS (MZ), a polymotectice (1) molecule having any one crown the identified TS (MZ), a polymotectice (1) molecule having any one comprising a fragment of a gene that encodes an HHV1 thymidine kinase protein from a drug-resistant HHV2 thymidine kinase protein from a drug-resistant HHV2, thymidine kinase protein from a drug-resistant HHV2, thymidine kinase protein, HHV4 latent membrane protein. HHV4 latent membrane protein. HHV4 latent membrane protein. HHV5 intermediate early protein, HHV6 allycoprotein BDNA, an HHV6 allycoprotein BDNA, HHV6 intermediate early protein, HHV6 allycoprotein Bor an HHV6 jlycoprotein B, and an HHV8 K1 glycoprotein (i.e. the target sequences), conclear protein, HHV6 and HHV6 intermediate early protein, an HHV7 glycoprotein B, and an HHV8 K1 glycoprotein (i.e. the target sequences), and a fluorosenic probe, and a fluorescent reporter group covalently attached to the probe, (M1) is useful for detecting infection by a tarached to the probe, (M1) is useful for creating a screening platform a trached to the probe or a strain of HHV in a sample from an individual consider the proper or a strain of HHV in a sample from an individual consider the offectiveness of pharmaceuticals by measuring the ability of anti-viral agents to mediate HHV propagation. (M1) allows accurate and consider from infection by another strain of the same HHV type. The method allows detection of infection by HHV that cannot be detected by conventional PCR approaches. In addition to determining specific acan conventional PCR approaches. In addition to determining specific acan conventional pCR approaches. In addition to determining specific acan conventional pCR approaches. In addition to determining specific acan conventional PCR approaches. In addition to determining specific acan conventional pCR approaches. In addition to determining specific acan conventional pCR approaches. In addition to determining specific acan conventional pCR approaches. In addition to determine the HHV4 muclear protein EB ö from the identified TS (M2), a polynucleotide (I) molecule having any one ö 0.8%; Score 13.6; DB 1; Length 20; 80.0%; Pred. ```
The invention relates to a marker for testing analogues of vitamin D expected to be effective in reducing aberrant activity of vitamin D responsive cell, comprises at least one gene pertinent to the action of vitamin D for testing the analogues and determining analogues capable of regulating the gene, and is indicative of a chemopreventive or chemoprerelating analogues of vitamin D expected to be effective in reducing aberrant activity of vitamin D-responsive cell or for testing analogues of vitamin D-responsive cell or for testing analogues of vitamin D-responsive coll and for testing a berrant activity of vitamin D-responsive cell, and for treating a disorder characterised by an aberrant activity of vitamin D-responsive cell, where the disorder is selected from cancer, psoriasis, multiple cell, where the disorder is selected from cancer, psoriasis, multiple cell, where the disorder is selected from cancer, psoriasis, multiple cell typerparathyroidism. The invention is useful for identifying regulated the principal for protecting against in vivo DNA damage, for inducing in vivo DNA repair mechanisms in a mammal, or for reducing or preventing DNA damage to the sixin of a mammal, preferably the invention is useful as a marker for the activity of DNA repair mechanisms. The invention is useful as a marker for the activity of DNA repair methibiting an enzyme which metabolises 1.25-dihydroxyvitamin D3 The invention is useful for testing compounds susceptible of inhibiting an enzyme which metabolises 1.25-dihydroxyvitamin D3 The invention is useful for treating expensed sequence is collagenase 1 gene specific RT-PCR primer
                Novel marker for testing analogs of vitamin D expected to be effective in reducing aberrant activity of vitamin D-responsive cell, comprises gene pertinent to action of vitamin D for testing the analogs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New isolated human or mouse targeting peptide useful for targeted

The invention relates to the screening of antitumour agents by using the interaction between ARP protein and HK33 (Housekeeping 33) protein.

Nuclear transport of ARF protein is inhibited by the expression of HK33 gene, and thus p53-dependent transcription is suppressed. In immortalised cells, moreover, the expression of HK33 gene is significantly elevated. The invention provides a method of screening an antitumour agent by using the interaction between ARP protein and HK33 protein. It also provides a method for utilisation of HK33 protein and agene encoding it in the examination of tumour related disease. The current sequence represents a ARP/HK33 protein related primer
delivery of therapeutic agents, for inhibiting angiogenesis, tumor growth or pregnancy, and for inducing apoptosis or weight loss.

The present invention describes a compound (I) 8-50 nucleobases in length targeted to a nucleic acid molecule (II) encoding a natural dominant regative regulator of caspase 8, Filp-c, where (I) specifically hybridises with and inhibits expression of the protein, or specifically hybridises with at least an 8-nucleobase portion of an active site on (II), (I) has antiinflammancory and anti-tumour activities. (I) is an inhibitor of Filp-c expression, a modulator of apoptosis and can be used in antisense gene therapy. (I) is useful for inhibiting the expression of Pilp-c in cells or tissues, and for treating an animal having a disease or condition associated with Filp-c. (I) is also useful for modulating apoptosis in a cell, where a caspase such as caspase 8, caspase 3 or caspase 7 is activated, and the Filp-c is the long form of Filp-c. (I) is also useful for diagnostics, therapeutics, prophylaxis, as research reagents and kits, for distinguishing functions of various members of biological pathway, and in antisense gene therapy. (I) is also useful compation. The present sequence represents mouse Filp-c inhibiting contact of the prophylactically, e.g., to prevent or delay infection, inflammation or tumour formation. The present sequence represents mouse Filp-c inhibiting contact which it is also useful for which it is a modulation or tumour formation. The present sequence represents mouse Filp-c inhibiting contact which it is a modulated by infection, inclement when we have a contact which it is a contact when the present sequence represents mouse Filp-c inhibiting contact when the present sequence represents mouse Filp-c inhibiting contact when the present sequence represents mouse Filp-c inhibiting contact when the present sequence represents mouse Filp-c inhibiting contact when the present sequence represents mouse Filp-c inhibiting contact when the present sequence represents mouse Filp-c inhibiting contact when the present sequence represents mouse Filp-c minibiting contact when the present sequence represents wings, which is used in an example from the present invention

Examination of aspermia comprising investigating an allele with correlation to aspermia if it is detected in the HLA-DQA1 locus.

Example 2; Page 4; 7pp; Japanese.

The present invention describes a method for the examination of aspermia in which, if an allele showing correlation to aspermia is detected in the Muman leukocyte antigen (HLA)-DQA1 locus, it is investigated, Also described is a method for the examination of aspermia in which one of the following (a) to (e) is investigated; (a) if the base sequence of the DNA corresponding to codon 64 of HLA-DQA1 gene is AGA; (b) if the base sequence of the DNA corresponding to codon 66 of HLA-DQA1 gene is AGG; (c) if the base sequence of the DNA corresponding to codon 68 of HLA-DQA1 gene is GTG; (d) if the base sequence of the DNA corresponding to codon 69 of HLA-DQA1 gene is GTG; (e) if the base sequence of the DNA corresponding to codon 69 of HLA-DQA1 gene is GTG; (d) if the base sequence of the DNA corresponding to codon 69 of HLA-DQA1 gene is GTG; (e) if the base sequence of the DNA corresponding to codon 69 of HLA-DQA1 gene is GTG; or (e) if the base sequence of the DNA

```
ö
corresponding to codon 71 of HLA-DQA1 gene is GTG. The method is useful for the examination of aspermia. The present sequence represents a PCR primer for the HLA-DQB1 locus, which is used in an example from the present invention

Novel isolated polypeptide comprising variant form of mouse or human SAC1 polypeptide, and is associated with altered preference for carbohydrates or other sweeteners, useful for preventing obesity, diabetes, alcoholism.

Claim 14; Page 91; 239pp; English.

The invention relates to an isolated polypeptide, comprising a variant form is a described form to find man SACI polypeptide. The variant form is associated with altered preference for carbohydrates, other sweeteners or ethanol. The polypeptide and its associated DNA sequence can be produced by recombinant techniques and is useful for preventing obesity, diabetes or alcoholism associated with SACI expression. The sequences are useful in screening for drugs and sweeteners. Recombinant call lines and transgenic correcting for drugs and sweeteners. Recombinant call lines and transgenic embryos may be used in screening for and identifying agents that induce or repress function of SACI. Predisposition to diabetes, obesity or alcoholism can be ascertained by testing any fluid or tissue of a human succession to diabetes, obesity and/or alcoholism and may provide a predisposition to diabetes, obesity and/or alcoholism and may provide a predisposition to diabetes, obesity and/or alcoholism and may provide a diagnostic mark. The polymucleotide can be detected in a biological sample by contacting the DNA with a probe to form a hybridiaation complex which is then detected. The sequences represent cDNA encoding human and AXS 77894

Also described are: (1) a protein expressed by the above human maturation/activation DC expression gene; (2) an antibody against the protein; and (3) an antagonist against the expression of each gene belonging to the above gene group. The gene group is useful for the treatment and the diagnosis of various human diseases related to human DC. ABL42927 to ABL42956 represent PCR primers for human maturation/ activation DC expression genes, which are used in the exemplification of

The antisense compounds, partitularly antisense oligonucleotides, target and inhibit the expression of human glioma-associated oncogene-1. The antisense compounds are useful for inhibiting the expression of human aliantisense compounds are useful for inhibiting the expression of human aliants associated oncogene-1 in human cells or tissues and for treating an animal, particularly a human suspected of having or being prone to a disease or condition associated with expression of glioma-associated oncogene-1. The compounds are useful for diagnostics, therapeuties and as research reagent, e.g. prophylactically to prevent or delay infection, inflammation or tumour formation. The antisense compounds are safely and effectively administered to humans. ABK30509-ABK30586 represent the antisense oligonucleotides of the invention which comprise a
Human glioma-associated oncogene-1 antisense oligonucleotide ISIS 124842.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Angiogenesis inhibitor; ss; angiogenesis; solid tumour growth; tumour metastasis; precancerous lesion; rheumatoid arthritis; psoriasis; diabetic retinopathy; retinopathy of prematurity; macular degeneration; corneal graft rejection; neovoacular glaucoma; retrolental fibroplasia; rubeosis; Osler-Webber Syndrome; myocardial angiogenesis; plaque neovascularisation; telangiectasia; haemophiliac joint;

administering at least one antianglogenic nucleic acid molecule. Also nucleic acid molecule. Also nucleic acid molecule. Also nucleic acids, and instructions for administering the antianglogenic having a condition characterised by unwanted anglogenesis. The method is tuesful for inhibiting anglogenesis associated with solid tumour growth, tumour metastasis, precancerous lesion, rheumatoid arthritis, psoriasis, diabetic retinopathy, retinopathy of premeturity, macular degeneration, conneal graft rejection, neovascular glaucoma, retrolencal fibroplasia, neovascularisation, telangiectasia, haemophiliac joints, anglofibroma, wound granulation, intestinal adhesions, atherosclerosis, scleroderma and hypertrophic scars. The present sequence is an antianglogenic nucleic acid of the invention
                                                                                                                                                                                                                                                                                                      Inhibiting angiogenesis in a subject, involves administering at least one antiangiogenic nucleic acid molecule to the subject.
angiofibroma, wound granulation, intestinal adhesion, atherosclerosis, scleroderma, hypertrophic scar.
                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to inhibiting angiogenesis in a subject,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Antibody-induced cell lysis; cancer; immunostimulatory; CD20; anglogenesis; metastasis; cytostatic; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 20 BP; 0 A; 6 C; 14 G; 0 T; 0 U; 0 Other;

The present invention relates to methods for treating or preventing cancer, involving administering to a subject having or at risk of developing cancer immunostimulatory nucleic acids that induce expression of cell surface antigens and antibodies. The methods are useful for treating or preventing cancer such as basal cell carcinoma, bladder cancer, bone cancer, brain and central nervous system (CNS) cancer, brass cancer, cervical cancer, olon and rectum cancer, connective tissue cancer, oesophageal cancer, eye cancer, kidney cancer, larynx cancer, leukaemia, liver cancer, lung cancer, Hodgkin's lymphoma, melanoma, myeloma, can cart, ran cavity cancer, oancer, acident cancer, pancreatic cancer, prostate cancer, rabdomyosarcoma, skin cancer, stomach cancer, testicular cancer, and uterine cancer. The present sequence is an immunostimulatory oligonucleotide described in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  /mod_base= OTHER
/note= "OTHER= Phosphorothioate internucleotide linkages,
bases 1-5 and 16-20 are 2'-methoxyethoxy (2'-MOE) bases.
All cytidine bases are 5-methylcytidines"
                                                                                               administering immunostimulatory nucleic acids that induce expression of cell surface antigens and antibodies to a subject having or at risk of developing cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; mouse; Protein Phosphatase 2 catalytic subunit alpha; diabetes; cancer; infection; inflammation; tumour formation; cytostatic; antidiabetic; phosphorothioate; ss.

The present invention relates to antisense oligonucleotides and methods for modulating the expression of human or mouse Protein Phosphatase 2 catalytic subunit alpha. The antisense oligonucleotides are useful for inhibiting the expression of Protein Phosphatase 2 catalytic subunit alpha and for treating diseases or conditions associated with aberrant expression of Protein Phosphatase 2 catalytic subunit alpha. Such diseases include diabetes and cancer. The antisense oligonucleotides are also useful for diagnostics, therapeutics, and prophylaxis, e.g. to prevent or delay infection, inflammation or tumour formation. They are also useful as research reagents for distinguishing between functions of various members of a biological pathway, ABS65400-ABS65477 represent human or mouse Protein Phosphatase 2 catalytic subunit alpha antisense oligonucleotides which comprise a phosphorothioate backbone

Novel HYPLIPI and FCHL1 genes and their sequence variations associated with lipid disorder and cancer, useful for prognosis, diagnosis and treatment of lipid disorders.

Claim 11; Page 76; 102pp; English.

This invention relates to the CDNA and protein sequences of novel proteins HYPLIP1 or FCHL1 and to sequence variations within these genes that have been shown to be associated with lipid disorders.

That have been shown to be associated with lipid disorders.

Oligonuclectide probes that hybridise to the CDNA sequence are useful for reasoring in the sample. A host call transformed with the CDNA of the mRNA invention is useful for producing the protein by recombinant means.

Pharmaceutical compositions based on the sequences of the invention are useful for preventing a lipid disorder associated with a varpession of FCHL1 such as familial combined hyperlipidaemia, coronary artery disease, atherogenic lipoprotein phenotype.

Cartery disease, atherogenic lipoprotein phenotype, hyperapobetalipoproteinsemia, hypertriglycenidaemia, familial dyslipidaemic hypertension, syndrome X, obesity, insulin resistance and hypercholesterolaemia. The CDNA sequence is useful in the diagnosis or prognosis of predisposition to lipid disorders and cancers, and also to ABK68325/

The invention relates to a compound of 8-50 nucleobases in length targeted to a nucleic acid encoding protein phosphatase 1B (PTP1B), where the compound specifically hybridises with and inhibits the expression of PTP1B (e.g. an antisense oligonucleotide). Also included are (1) a compound of 8-50 nucleobases in length which specifically hybridises with an a nucleobase portion of an active site on a nucleic acid encoding PTP1B; (2) inhibiting the expression of PTP1B in cells or tissues comprising contacting the cells or tissues with the compound; treating an animal having or usuperced of having a disease or condition associated with PTP1B comprising administering the compound; (4) decreasing blood sugar levels in an animal comprising administering the compound; (5) preventing or delaying the onset of a disease or condition associated with PTP1B in an animal comprising administering the compound; (6) preventing or delaying the onset of an increase in blood glucose levels
identify a molecule which enhances or decreases the HYPLIP1 or FCHL1 activity. The present sequence represents an oligomucleotide primer specific for the mouse HYPLIP1 locus of the invention. The mouse HYPLIP1 locus is situated on chromosome 3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Compound for inhibiting the expression of protein phosphatase 1B (PTP: and for treating diabetes, cancer, or obesity, comprises an antisense oligonucleotide targeted to nucleic acid encoding PTP1B.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Antisense; protein phosphatase 1B; PTP1B; se; probe; human; type 2 diabetes; obseity; ovarian cancer; chronic myeloid leukaemia; hyperproliferative disease; antidiabetic; anorectic; cytostatic; blood glucose; gene therapy.

This invention relates to an antisense compound encoding Fas, Fas ligand, or Fas associated protein-1 (Fap-1). The inhibition of Fas mediated signalling is thought to be immunosuppressive, antiinflammatory, hepatotropic, cytostatic and vasotropic. Antisense oligonucleotides were designed to target human Fas. Oligonucleotides were synthesised as chimeric oligonucleotides and are useful for treating an animal having an autoimmune or inflammatory disease e.g., hepatitis, cancer, a condition associated with apoptosis, allograft rejection, or ischemia reperfusion injury. Optionally, the above mentioned conditions are prevented by contacting the allograft with the antisense oligonucleotide. The
in an animal comprising administering the compound. The compound is used to inhibit the expression of PTPLB in cells or tissues, to treat or prevent or delay the onset of a disease or condition associated with PTPLB, such as type 2 diabetes, obesity, cancer (especially ovarian cancer, chronic myeloid leukaemia and hyperproliferative diseases in an animal having or ususpected of having the disease or condition, and for decreasing blood sugar levels or preventing or delaying the onset of an increase in blood glucose levels in an animal. The compound is also used kits. The present sequence is an antisense compound of the invention targetting human PTPLB
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel antisense compound targeted to nucleic acid encoding Fas, Fas ligand or Fas associated protein-1 is useful for inhibiting expression of Fas, Fas ligand, or Fap-1 in cells or tissues, and for treating hepatitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human, immunosuppressive; antiinflammatory; hepatotropic; cytostatic; vasotropic; hepatitis; cancer; allograft rejection; ds; Fas.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to antisense oligonucleotides of at least 10 bases complementary to inducible human phosphofructokinase-2 (iPFK-2) cDNA. The antisense oligonucleotides can be included in anticancer or antiinflammatcry pharmaceutical compositions along with an oligonucleotide carrier. An iPFK-2 antisonist such as an enzymatic inhibitor, anti-iPFK-2 antibody, or iPFK-2 antisense molecule can be administered for treating inflammatory disease or rapidly-growing cancers. The present sequence represents an iPFK-2-specific sense oligonucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel antisense oligonucleotides useful for treating inflammatory diseases or cancers, comprises complementary sequence of inducible human
oligonucleotides are used in diagnostics, therapeutics, prophylaxis and as research reagents and in kits. The oligonucleotides are also useful for research purposes. The present nucleotide sequence is related to
                                                                                                                                                                                                                                                                                                                                                                                     iPFK-2-specific oligonucleotide S-iPFK-2 (A) (sense, position 35-55).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

The invention relates to antisense oligonucleotides of at least 10 bases complementary to inducible human phosphofructokinase-2 (1PFK-2) cDNA. The antisense oligonucleotides can be included in anticancer or antiinflammatory pharmaceutical compositions along with an oligonucleotide carrier. An iPFK-2 antagonist such as an enzymatic inhibitor, anti-iPFK-2 antibody, or iPFK-2 antisense molecule can be administered for treating inflammatory disease or rapidly-growing cancers. The present sequence represents an iPFK-2-specific antisense oligonucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel antisense oligonucleotides useful for treating inflammatory diseases or cancers, comprises complementary sequence of inducible human phosphofructokinase-2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; chromosome 1p36-35; chromosome 21q22.1; genetic analysis; genome;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

Arraying genome clones.

WPI; 2002-144136/19. (GENO-) GENOTEX YG.

```
The present invention describes a method of arraying genome clones. The method comprises: (a) clones of the genomic libraries contained in method comprises: (b) clones of the genomic libraries contained in multiwell plates unbered for discrimination are mixed in each of the multiwell plates; (b) a primer designed based on the chromosome marker sequence is added to the mixture to carry out an amplification reaction; (c) a mildivell plates; (b) a primer designed based on the chromosome marker sequence is added to the mixture to carry out an amplification reaction; (c) amplified product to specify the discrimination Nos. of the multiwell plates containing the clones having said marker sequence; (d) the order of the maximum in the specified discrimination Nos. succeed to the maximum in the specified discrimination Nos. to array the multiwell plates; (e) the clones in the miltiwell plates of the specified discrimination Nos. are mixed respectively in each wells of longitudinal and lateral directions; (f) the mixed clones are ordered from the amplified products; (h) the clones in the multiwell plates are specified from the detected result; and (i) the clones are reconstituted as the positions on the chromosome and arrayed. The mixed contains the positions on the chromosome and arrayed. The represent for human chromosome 1972; which are prepared.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; chromosome 1p36-35; chromosome 21q22.1; genetic analysis; genome;

The present invention describes a method of arraying genome clones. The method comprises: (a) clones of the genomic libraries contained in method comprises: (b) clones of the genomic libraries contained in multiwell plates; (b) a primer designed based on the chromosome marker sequence is added to the mixture to carry out an amplification reaction; (c) a signal corresponding to the marker is defected from the resultant amplified product to specify the discrimination Nos. of the multiwell plates containing the clones having said marker sequence; (d) the order of the markers is changed so that the same discrimination Nos. succeed to the maximum in the specified discrimination Nos. to array the multiwell plates; (e) the clones in the multiwell plates of the specified discrimination Nos. are mixed respectively in each wells of longitudinal discrimination Nos are mixed respectively in each wells of longitudinal creation to the amplified products; (h) the clones in the multiwell plates are specified from the detected from the multiwell plates are specified from the detected; (h) the clones are reconstituted as the positions on the chromosome and arrayed. The microarray is useful for gene analysis. ABL45357 to ABL45322 represent represent POR primers for human chromosome 21q22.1, which are represent represent for plaimer for human chromosome 21q22.1, which are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel antisense compound for modulating expression of human helicase-moi

The invention comprises antisense oligonucleotides which are targeted to the coding region of the human helicase-moi gene. The antisense oligonucleotides of the invention are useful for inhibiting the expression of human helicase-moi in cells or tissues, and for treating a helicase-moi-associated condition. The antisense oligonucleotides of the invention may also be used to delay infection, inflammation and tumour formation. The present DNA sequence represents a human helicase-moi gene antisense oligonucleotide of the invention. NOTE: The present DNA sequence has a phosphorothicate backbone, bases 1-5 and 16-20 are 2'-methoxyethyl (2'-MOE) nucleotides and for treating inflammation, specifically hybridizes to a specific region in nucleic acid molecule encoding the human helicase-moi. Culturing cells such as neuronal cells for use in treating neurological disorders, comprises generating embryoid bodies from undifferentiated embryonic stem cells, selecting precursor cells, expanding and differentiating them.

Example 10; Page 40; 66pp; English

The invention provides a method of culturing cells. The method involves expanding a culture of undifferentiated embryonic stem (ES) cells, generating embryoid bodies (EB), culturing the bodies to select for central nervous system (CMS) precursor cells (PC), culturing PC in an

expansion medium comprising a neurologic factor, and differentiating and culturing the expanded PC to form a culture of differentiated neuronal cells useful for culturing undifferentiated BS cells to form differentiated sells to form differentiated sells to form differentiated neuronal cells which are useful for treating a neurological disorder, especially Parkinson's disease in a patient. A grain derived neurotrophic factor (BDNF), brGF, glial derived growth factor (GDNF) NT-3, and NT-4/5 can be introduced into a brain of a superior neuronal cells. The differentiated neuronal cells are useful for culturing dopaminergic, cholinergic subject. The method is useful for culturing dopaminergic, cholinergic and servicensry neuronal cells. The differentiated neuronal cells are useful for treating neurological disorders such as Runtington's disorders of mood and chording epilepsy, familial dysauconomia as well as injury or trauma to the nervous system such as neurotoxic injury or disorders of mood and soldsorders estimated as stroke and CNS disorders resulting from aging. Assays are useful for the versularity drugs capable of regulating the survival, profileration or genesis of neuronal cells and to screen for angenist or agonist of dopamine or serotonin. Cell cultures comprising 50% 85% neurons which companies 20 + 40% dopaminergic neurons and 1-3% astrocytes are useful for studying the mechanism of neuronal cells and to screen for any sold such as stroke and companies of electrophysichemical properties of differentiated neuronal cells.

The present invention describes a method for identifying oligonucleotides with desired hybridisation properties to nucleic acid targets containing accondany structure. The method comprises amplifying a target nucleic acid having at least one accessible and one inaccessible site. Primers that form an extension product are identified as the oligonucleotides which can interact with the folded target nucleic acid. Oligonucleotides from the present invention can be used in novel detection methods for clinical diagnostic purposes, including the detection and identification of pathogenic organisms (e.g. HrV). The method allows the ability to rapidly analyse nucleic acid structures. ABL46034 to ABL46367 represent sequences used in the exemplification of the present invention

New mutated eukaryotic initiation factor 2 alpha kinase 3 genes and polypeptides in patients with Wolcott-Rallison syndrome, useful for preventing or treating e.g. diabetes, osteoporosis, arthritis or mental retardation.

Example 4; Page 31; 93pp; English.

The invention relates to an isolated variant of a mammal genomic sequence of the gene coding for the translation initiation factor 2 alpha kinase 3 (EIPIRAKA). The EIPIRAKA nucleic acid variant is useful for the production of a recombinant or synthetic polypeptide, and for screening compounds capable of modulating EIPIRAS. The nucleic acid is also useful for

The invention relates to a composition comprising one or more nucleic acid molecules and at least one oligonuclectide, where at least a portion of the oligonuclectide is capable of hybridising with at least a portion of the nucleic acid molecule and where the oligonuclectide comprises a modified nuclectide at or near the 3'-terminal nucleotide. The various analogue oligonuclectides are useful for quantification or detection of one or more target nucleic acid molecules in a sample during nucleic acid

screening or diagnosing the diseases cited below. The nucleic acid of may be used as sense or anti-sense oligonucleotide. The nucleic acid may also be used as primer or a probe, for detecting and/or amplifying a nucleic acid sequence. The compound is useful as a medicament, particularly for preventing and/or treating diabetes and/or pathology related to WRS, e.g. type I diabetes, type 2 diabetes, the others forms of diabetes, the compound is useful as a medicament, particularly for creal dysfunction, or mental retardation. The cell the mammal or the creating is useful for studying the expression or the activity of the BIP2AK3 protein, and the direct or indirect interactions between the circularly continued in the activity of the BIP2AK3 protein and chemical or biochemical compounds, which may be interacting directly or indirectly biochemical compounds capable of interacting directly or indirectly with the BIP2AK3 protein, and/or interacting the activity of the BIP2AK3 protein, and/or capable of modulating the expression or the activity of the BIP2AK3 protein, and/or capable of modulating the expression or the activity of the BIP2AK3 protein, and companied or protein. The invention relates to a composition comprising one or more nucleic acid molecules and at least one oligonucleotide, where at least a portion of the oligonucleotide is capable of hybridising with at least a portion of the nucleic acid molecule and where the oligonucleotide comprises a modified nucleotide at or near the 3'-terminal nucleotide. The various analogue oligonucleotides are useful for quantification or detection of one or more target nucleic acid molecules in a sample during nucleic acid consorted as a sample during nucleic acid consorted acid molecules are also useful for determining the presence or absence of one or more particular nucleotides at a specific position or positions in a target nucleic acid molecule. The analogue oligonucleotides can also be useful for synthesising or mucleic acid templates or targets with the analogue oligonucleotides, and incubating the mixture to synthesise or amplify one or more nucleic acid molecules complementary to all or a portion of the templates or targets. This polynucleotide sequence represents a nucleic acid detection and discrimination related oligonucleotide of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention comprises antisense oligonucleotides designed to inhibit expression of Syntaxin 4 interacting protein. The antisense oligonucleotides of the invention are useful for inhibiting the expression of Syntaxin 4 interacting protein in cells or tissues. The antisense oligonucleotides are also useful for treating an animal having a disease or condition associated with Syntaxin 4 interacting protein (e.g. diabetes, obesity or a skeletal muscle disorder). The antisense oligonucleotides can also be used to prevent or delay infection, frommanion and tumour formation. The present DNA sequence represents a human Syntaxin 4 interacting protein antisense oligonucleotide. NoTE: The present gequence contains a phosphorothioate backbone and 2'-0-
                                                                                                                                                                                                                                                                                                                                 Human; antisense gene therapy; Syntaxin 4 interacting protein; ss; antisense oligonucleotide; diabetes; obesity; skeletal muscle disorder; inflammation; tumour formation; phosphorothioate backbone; 2.-0-methoxyethyl wing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel antisense compound that hybridizes and inhibits nucleic acid molecule encoding Syntaxin 4 interacting protein, useful for treating diabetes, obesity and skeletal muscle disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

The invention relates to constructing (M1) a strain of diploid fungal cells in which both alleles of a gene are modified, comprising modifying constalled by insertion or replacement by a cassette having an expressible selectable marker and modifying other allele by recombination, of a promoter replacement fragment with a heterologous promoter, so that expression of the second allele by the promoter for constructing a strain of diploid fungal cells in which both alleles of a gene are modified. The diploid fungal cells in which both alleles of a gene are modified. The diploid fungal contributes to the virulence and/or pathogenicity of a fungus, a gene that is essential to the survival or growth of a fungus, a gene that contributes to the virulence and/or pathogenicity of a fungus of and for identifying a therapeutic agent for treatment of a mammalian agent, an antifungal agent that inhibits the growth of a diploid fungus continuous and for identifying a compound which modulates the activity of a gene product, preferably entranscriptional, agent by compound catabolism, biosynthetic, transporter, transcriptional, carbonism, biosynthetic, transporter, transcriptional, asimal transduction, DNA replication and cell division activity. The method is useful for identifying a compound having the cranslational, signal transduction, DNA replication and cell division activity. The method is useful for identifying a compound having the treating infection by C. albicans. This invention describes a novel murine calpain protease 12 (capn12). The calpain protease of the invention, related proteins and nucleic acid that encodes it, are useful for treatment (including gene therapy) of diseases associated with insufficient expression of the calpain protease. The special is also used to screen for calpain protein effectors and to raise polynucleotide encoding capn12 is useful, e.g. as primers and probes, for diagnosis of diseases, or predisposition to them, and for recombinant production of capn12. This sequence represents the murine calpain 12, capn12 exon 19 splice donor site described in the disclosure of the
                                                                                                       Calpain protease; murine; gene therapy; screening; diagnosis; capn12; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New calpain protein 12 with cysteine protease activity, useful for treating specific deficiency disorders.

This invention relates to an isolated polynucleotide encoding human NEDD-1, which is cytostatic in its action. The polynucleotide is useful for diagnosing diseases caused by mutation in human NEDD-1, and for diagnosing or monitoring diseases caused by altered expression of human NEDD-1. Fragments of NEDD-1 are useful as hybridisation probes and primers, and to direct expression or synthesis of epitopic or immunogenic protein fragments. The proteins are useful as therapeutic supplement in patients with specific deficiency in human NEDD-1 production, and for treating subjects preferably with defects in NEDD-1. The present sequence is a PCR primer related to human NEDD-1.

Polynucleotide and polypeptide of human NEDD-1 useful for diagnosing, treating or preventing a disorder associated with decreased or increased expression or activity of the polypeptide.
